

EDITION: 2026

The Storm Restoration Playbook

A practical field guide for roofing teams running post-storm canvassing.

How to Use This Playbook

This playbook is written for execution, not theory. Treat it like an operating manual:

- Read the Quick Start and run it immediately after a storm.
- Use Section 1 to choose where to deploy (don't waste doors).
- Use Section 2 to choose when to deploy (maximize contacts per hour).
- Use Section 3 to prevent overlap, disputes, and double-knocks.
- Use Section 4 to prevent leakage (follow-ups + handoffs don't happen by memory).
- Use Section 5 to recognize when spreadsheets are hurting you.
- Use Section 6 to evaluate the next toolset without getting distracted.

If your team is overwhelmed, do one thing first:

Every lead must have Next Action Due. No exceptions.

Definitions

You don't have a tracking system unless the whole team speaks the same language.

Knock

A door attempt with a timestamp and outcome (even "no answer").

Contact

A real interaction with an adult at the property (not a ring cam conversation).

Lead

A property record that includes an address, owner/contact info (if available), a current stage, and Next Action Due.

Booked Inspection

A scheduled date/time (not "maybe this weekend").

Signed

Agreement signed and the home is Protected (no one else knocks it).

Protected

A status that blocks duplicate outreach internally.

Zombie Lead

A lead with no Next Action Due or no touch for 7+ days (it's leaking revenue).

THE 3 NUMBERS TO RUN DAILY (THE MINIMUM SCOREBOARD)

Run these three numbers every morning and every night. If these are healthy, you're in control.

- **Knocks → Contacts rate:** Shows turf quality + timing quality + rep effort.
- **Contacts → Booked Inspections:** Shows script effectiveness + neighborhood fit.
- **Booked Inspections → Signed:** Shows close strength + follow-up discipline.

Quick start (Day 0 to Day 1)

Day 0 (storm day / first 12 hours)

- Pick a target area (core swath first).
- Assign turf fast (even a rough grid)
- Set your tracking sheet/system with controlled stages + Next Action Due required.

Day 1 (first full canvassing day)

- Tighten turf boundaries (door count, not square footage).
- Start logging every knock with one-tap outcomes.
- Manager runs the scoreboard twice (midday + end-of-day).
- Protect any home with a booked inspection or signed agreement.

Section 1 - Neighborhood Prioritization Framework

Your goal isn't "knock more doors." It's to knock on the right doors first.

LAYER 1: STORM DATA

You don't need perfect data, you need a deployable signal. Field rule: Prioritize areas where collateral damage is visible.

Collateral damage is your porch proof:

- dented gutters/downspouts
- vents/flashing impacts
- AC fins
- fascia/siding marks

Operator checklist (Layer 1)

- Identify the highest-intensity area (the "core").
- Look for visible collateral on the first street you enter.
- If collateral is light across multiple blocks, downgrade the tier. Deploy strongest reps first to highest-signal streets.

LAYER 2: ROOF AGE - THE "GOLDILOCKS ZONE"

Storm viability is impact + roof vulnerability.

Practical targeting:

- 0-5 yrs: lower priority
- 10-20 yrs: highest yield
- 20+ yrs: verify early (policy/out-of-pocket risk can slow or kill deals)

Operator checklist (Layer 2)

- Filter target neighborhoods for 10-20 year roofs.
- Train reps to tag roof age: New / Mid / Old / Unknown.
- Prioritize mid-life roofs during the first 10 days.

LAYER 3: INSURANCE COMPANIES

A damaged roof can still be a dead lead if the homeowner can't or won't move forward.

Field rule: Capture the carrier early, respectfully. "Just so we document correctly, who's your carrier?"

Manager rule: Track carrier patterns by zip / neighborhood tier. If a carrier pattern becomes consistently slow or combative, assign stronger reps there or downgrade the neighborhood for volume.

LAYER 4: OWNER VS. RENTAL

Rentals slow velocity because the decision-maker is absent.

- **Field rule:** Owner-occupied streets first during the blitz.
- Log rentals, don't chase them unless you have a landlord workflow.

NEIGHBORHOOD PRIORITIZATION SCORING MATRIX (EXAMPLE)

Use this exactly as a quick tiering system:

METRIC	TIER 1 (DIAMOND)	TIER 2 (GOLD)	TIER 3 (SILVER)	TIER 4 (BRONZE)
Hail size	> 2.0 in	1.5-2.0 in	1.0-1.5 in	< 1.0 in
Roof age	15+ yrs	10-15 yrs	5-10 yrs	< 5 yrs
Owner occupancy	90%+ owner	70-90% owner	Mixed/unknown	High rental
Action	Blitz deployment	Targeted canvass	Secondary sweep	Do not deploy

How to use it: Tier neighborhoods fast, then assign turf. Don't overthink the model, execute and refine.

Section 2 - Best Times to Knock

The best turf in the world is worthless if nobody answers the door.

The Golden Window (weekdays 4-8 PM)

This is prime time for decision-makers.

Operating rule: Cancel internal distractions during this window. Managers coach in-field. Reps are on turf.

Saturday morning strategy (10 AM - 1 PM)

This window supports: longer conversations, more on-the-spot inspections, easier scheduling.

The Valley of Death (weekdays 12-3 PM)

Contacts drop. Don't burn morale. Do this instead:

- follow-ups due today
- admin hygiene (notes/photos/status)
- travel to next zone
- coaching/roleplay
- optional light commercial touches

Storm Week exceptions (Days 1-3)

In the first 72 hours, norms shift. More homeowners are present during daytime because they're dealing with the aftermath.

Operating rule: Expand knocking hours early, then return to the Golden Window once the neighborhood stabilizes.

DATA-BACKED CANVASSING SCHEDULE (EXAMPLE)

TIME BLOCK	MON-FRI	SATURDAY	SUNDAY	OPERATIONAL FOCUS
9 AM - 12 PM	Low (commercial/admin)	High (prime)	Low (avoid)	Commercial/admin (M-F) / Resi (Sat)
12 PM - 3 PM	Very low	Moderate	Low (avoid)	Commercial, lunch, transit, follow-up
3 PM - 5 PM	Moderate (transition)	Moderate	Low (avoid)	Prep, drive to zone
5 PM - 8 PM	Peak	Low/social	Low (avoid)	All hands on turf

Section 3 - Territory Management

At scale, the enemy is internal chaos: overlap, disputes, and double-knocks.

Turf cutting: opportunity equality, not square footage

Assign turf by door count, not "zip code" or "square miles." Rule of thumb: 80-120 doors per rep per prime session (adjust for density).

3 WAYS TO WIN THE STORM

- **Grid method:** Fast and simple for rapid deployment, but ignores density differences.
- **Performance tiering:** Top reps get Diamond/Gold; juniors get Silver for development. Works best when performance metrics are visible and fair.
- **Rotation system:** Rotate every 3-5 days to rework missed contacts and reduce turf fatigue. Requires clean logging so it doesn't create duplicates.

RULES OF ENGAGEMENT (ROE) THAT PREVENT INTERNAL CONFLICT

Keep it strict and simple:

1. First logged wins (timestamps decide ownership).
2. Protected means protected (no contact after booking/sign).
3. 7-day re-knock buffer unless scheduled.
4. 30-day expiry if no progress lead returns to pool.
5. The manager is final on disputes.

POLYGON METHOD VS. GRID ASSIGNMENTS

Grid = speed. Polygon = precision. Start with a grid if you must, but move to polygon boundaries as soon as you can.

Manager checklist (daily)

- Turf assigned by door count
- Boundaries shared (map screenshot posted)
- Protected homes are marked protected
- Re-knock buffer enforced
- End-of-day: all new leads have Next Action Due

Section 4 - The Tracking System

Your tracking system is either a machine that generates daily actions, or a list that leaks revenue.

ESSENTIAL DATA FIELDS FOR HIGH-VOLUME TRACKING (MINIMUM)

CATEGORY	FIELD	WHY IT MATTERS
Identity	Lead ID	Prevents duplicates and confusion
Identity	Address / City / Zip	Routing, swath grouping, territory ownership
Identity	Homeowner name + phone	Follow-up and verification
Qualification	Owner vs renter	Decision-maker filtering
Qualification	Roof age (or proxy)	Viability targeting (10-20 yrs recommended)
Qualification	Damage indicators	Consistent documentation (dropdown)
Insurance	Insurance carrier	Pattern learning by zip
Pipeline	Stage (controlled)	Clarity on where each lead sits
Pipeline	Last touch date	Detect neglected leads early
Pipeline	Next action due	Daily to-do driver (non-negotiable)
Media	Photo link / folder	Proof, supplements, production handoff
Production	Handoff checklist complete (Y/N)	Sales-to-production QC

CONTROLLED VOCABULARY (RECOMMENDED STATUSES)

Use these exact statuses (or fewer). Don't allow free-text stages.

- New lead (not yet contacted)
- Attempted no answer
- Contacted - follow-up needed
- Inspection booked
- Inspection complete

- Proposal sent
- Signed same day
- Signed - pending production handoff
- Lost/not interested
- Do not knock

SAMPLE DAILY WORKFLOW (STORM WEEK)

- **Morning (manager):** Filter "Next Action Due = today" → assign tasks first. Then assign turf. Post scoreboard targets.
- **During prime time (reps):** Log knock outcome immediately. If contact happens, set Next Action Due before moving on.
- **End of day:** Confirm every new lead has Next Action Due. Mark protected homes. Attach photos/notes (short + factual).

Zombie leads - identify them before they die

A lead becomes a zombie when:

- Next Action Due is blank, OR
- Last Touch Date is older than 7 days, OR
- It's "Contacted - follow-up needed" without a scheduled next step

Manager action: run a "Zombie Sweep" every morning.

Section 5 - Why Spreadsheets Fail at 500+ Leads

Spreadsheets don't fail because they're bad. They fail because storm work is fast, mobile, and team-based.

Data degradation

Typos, duplicates, missing fields, inevitable under pressure.

Zombie leads

Follow-ups depend on memory. Memory fails.

Geospatial disconnect

Lists don't represent geography. Routing becomes inefficient.

Collaborative friction

Photos, notes, docs, and ownership fragments across tools and people.

If you see these symptoms, you are at the breaking point: duplicates happen weekly, follow-ups get missed, managers can't see reality, photos/notes aren't attached, turf disputes happen, reps resist logging.

Section 6 - When to Scale Up to Knockio

CAPABILITY CHECKLIST FOR A STORM-READY SYSTEM

A storm-ready system should:

- enforce Next Action Due (required)
- make field logging fast enough that reps actually use it
- prevent duplicates and show ownership clearly
- support turf boundaries (polygon or equivalent)
- keep photos + notes + signed docs in one record
- support imports (CSV/Zapier)
- provide handoff clarity (Sales → Ops)

WANT TO RUN THIS PLAYBOOK ON AUTOPILOT?

If you are juggling spreadsheets plus routing and e-sign, you are paying a leakage tax. A map-first workflow keeps territories, follow-ups, and handoffs in one place so leads do not slip.

[Book a demo](#)

Appendix - 30-Day Storm Blitz Plan (Print This)

Use this as your operating cadence. Adjust based on storm size and team capacity.

PHASE	PRIMARY GOAL	WHERE TO DEPLOY	MANAGER FOCUS
Shock & Deploy (Days 1-3)	Fast coverage + lead capture	Diamond/Gold core swath	Turf cut + coverage + daily scoreboard
Scale & Systemize (Days 4-10)	Convert contacts → booked inspections	Diamond/Gold + expand edges	Follow-up SLA + prevent duplicates
Conversion Sprint (Days 11-20)	Increase signed rate + handoff quality	Rework missed streets + rotation	Pipeline velocity + ROE enforcement
Extraction (Days 21-30)	Close warm leads; clean pipeline	Best-performing turfs only	Zombie rescue + reassign/expire

Appendix - ROE one-pager (copy/paste)

1. First logged wins (timestamps decide).
2. Protected is strict (inspection booked/signed = no one else touches).
3. 7-day re-knock buffer unless scheduled.
4. 30-day expiry if no progress → back to pool.
5. Manager decides disputes (final).

Appendix - Controlled vocabulary (minimum set)

- New lead (not yet contacted)
- Attempted - no answer
- Contacted - follow-up needed
- Inspection booked
- Inspection complete
- Proposal sent
- Signed same day
- Signed - pending production handoff
- Lost / not interested
- Do not knock

Disclaimer: This guide is based on years of industry experience and is intended for educational purposes only. While we cannot guarantee that you will track 500+ leads, teams who have implemented these strategies have successfully standardized their workflows and achieved significant progress in their storm operations.
